

TURBIDITY BARRIERS

Turbidity Barriers are a BMP designed to restrict the flow of sediment-laden stormwater runoff from a construction site, to keep it contained in a limited area, and allow the sediment to settle out before being carried into adjacent or joining watercourses. Our Turbidity Barriers are manufactured with the expertise of industry-leading professionals

Turbidity Barriers are available in two different forms:
Floating and Staked.

Floating Turbidity Barriers consist of a top flotation boom, an impervious fabric curtain extending downward under water, and a heavy galvanized steel chain sealed into a hem along the entire bottom of the curtain to provide ballast to keep the curtain vertical in the water. End hems are sealed around a rope and grommets to allow attachment to each other with rope or bolt/nuts/washers. Color is Yellow.

There are three major design types of Floating Turbidity Barriers: Type 1, Type 2, and Type 3—and all meet or exceed all known federal and state governmental specifications, including NPDES Phase II requirements.
